

Demonstrating the Value of the Laboratory Partnerships with Case Management

Andrew Fletcher, MD, MBA, CPE, CHCQM, FCAP

Learning Objectives

- Identify and discuss potential laboratory strategies to address length of stay issues
- Describe how laboratory tests can impact transitions of care and readmissions
- Demonstrate how laboratory tests can influence denials in payment due to medical necessity
- Discuss how laboratory testing can improve hospital acquired conditions

Definition of Case Management

Case management is a collaborative process of assessment, planning, facilitation, care coordination, evaluation, and advocacy for options and services to meet an individual's and family's comprehensive health needs through communication and available resources to **promote patient safety, quality of care, and cost-effective outcomes.**

<https://www.cmsa.org/who-we-are/what-is-a-case-manager/>

§ 482.30 Condition of participation: Utilization review.

- The hospital must have in effect a utilization review (UR) plan that provides for review of services furnished by the institution and by members of the medical staff to patients entitled to benefits under the Medicare and Medicaid programs.

Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)

NQF ENDORSEMENT STATUS: Endorsed | NQF ID: 0500 | MEASURE TYPE: Process | INFO AS OF: Not available | CMIT ID: 1017 | REVISION: 1

This measure focuses on adults 18 years and older with a diagnosis of severe sepsis or septic shock. Consistent with Surviving Sepsis Campaign guidelines, **the measure contains several elements, including measurement of lactate**, obtaining blood cultures, administering broad spectrum antibiotics, fluid resuscitation, vasopressor administration, reassessment of volume status and tissue perfusion, **and repeat lactate measurement**. As reflected in the data elements and their definitions, these elements should be performed in the early management of severe sepsis and septic shock.
